

Figure 1: Schematic representation of the 1200 bp DNA fragment containing the 5' flanking region of the human PAB1 gene. The diagram shows the gene structure with exons as boxes and introns as lines. The 5' flanking region is indicated by a bracket on the left. The 5' end of the gene is marked with a star. The 3' end of the gene is marked with a triangle. The 5' flanking region is divided into three segments: the first segment contains the 5' end of the gene, the second segment contains the 5' end of the gene, and the third segment contains the 5' end of the gene. The 5' flanking region is divided into three segments: the first segment contains the 5' end of the gene, the second segment contains the 5' end of the gene, and the third segment contains the 5' end of the gene.
